EXAMINER CHAU, LINDA N				
ART UNIT 1794		PAPER NUMBER		
NOTIFICATION DATE 08/24/2009		DELIVERY MODE ELECTRONIC		

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

ctkeyner@hhlaw.com
LAUSPTO@hhlaw.com
lbrivero@hhlaw.com

Continuation of 3 and 11:

Applicant disagrees with the examiners that the present claim does not define the limitation of having the Fe^{2+} be reduced by Zn. However, when x is 0.10 and a is 1.5 in the present claims, the Fe^{2+} is *not* reduced by Zn.

Applicant also argues that Kijima doesn't teach the Zn content as presently claimed. As noted above, the present claim is not defined as Fe^{2+} being reduced by Zn. Therefore, Kijima is proper to use. Further, Kijima discloses that Zn is added to the compound such that zinc is 1.0-10mol% of Fe^{2+} (claim 1). Kijima doesn't explicitly disclose that Zn is in a form $\text{Zn}_{(\text{ox})}$ described by the limitation. However, on the one hand, it would have been obvious to one of ordinary skill in the art at the time of the invention to have the range of zinc as described by the applicant based upon the mole percentages. In light of the amount of Zn disclosed by Kijima, it would have been obvious to one of ordinary skill in the art at the time of the invention to use amounts of Zn and Fe^{2+} , including those presently claimed, in order to produce stabilized W phase that does not deteriorate (pg. 7). On the other hand, given that Kijima discloses ferrite magnet powder with similar properties and functions, as presently claimed, it would appear that the composition of zinc would overlap the range claimed by the applicant. Regarding Kijima's examples of iron and zinc's compound quantity, it is noted that "applicant must look to the whole reference for what it teaches. Applicant cannot merely rely on the examples and argue that the reference did not teach others." In re Courtright, 377 F.2d 647, 153 USPQ 735,739 (CCPA 1967).

Applicant argues that Kijima fails to disclose a sintered magnetic and a magnetic recording medium. Kijima uses the magnetic powders in plastic magnets or bonded magnets and

teaches that it known in the art to incorporate the ferrite magnet powder in sintered magnets (pg. 3). However, Kijima further emphasizes that plastic magnets have various advantages over sintered magnets (pg. 3-4). Therefore, Kijima teaches that it can be used in sintered magnets but doesn't produce the desired magnetic characteristics. Kijima is not used to teach a magnetic recording medium. This is already taught by Taguchi.

In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and *In re Jones*, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, Kijima is used to teach the composition as claimed and Toyota is used to teach the saturation magnetization of a ferrite powder. Further, application argues that Kijima discloses that a residual magnetic flux density B_r attains a maximum of 3.15 kG while applicant has a claim of 4.2 kG or more. Applicant argues that if Kijima taught Applicant's composition, then the measured properties would be expected to be the same. Kijima *only* showed a working example of the composition and not the overall result. It is deemed that Kijima teaches the same properties as presently claimed, as set forth above. **Further, the working examples show the results of a remnant flux density (B_r) and not the saturation magnetization (M_s) as presently claimed. These two magnetic properties are related, but different.**

Applicant argues that the composition of Toyoda cannot be construed to impart the same properties on a different composition of Kijima because it is unclear how one in the art can apply

the inherent properties of one composition to a different composition. In response to applicant's arguments against the references individually, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986). Although Toyota doesn't specifically teach the same composition of Kijima, however, it is in the same field of endeavor, W-type ferrite magnet. Therefore Toyota is proper to use with Kijima.

Applicant argues that Taguchi fails to disclose applicant's saturation magnetization of 5.0 kG, but does teach a squareness of 80% or more. However, Taguchi is not used to teach saturation magnetization. This is already taught by Toyota. Further, in Table 4 of Taguchi, when the saturation magnetization is increased, the squareness is also increase. Therefore, it is deemed that Toyota's magnetic particle would also have a squareness of more than 80%.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to LINDA CHAU whose telephone number is (571)270-5835. The examiner can normally be reached on Monday-Thursday, 8:00-5:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mark Ruthkosky can be reached on (571) 272-1291. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
